

AI Fluency: The Partnership Architecture

Frameworks and foundations for effective human-AI collaboration.

NotebookLM

Three Ways to Engage

Automation

Definition: AI completes a specific, constrained task based on explicit instructions.

Example: Summarize this 10-page report into 3 bullet points.

Augmentation

Definition: Continuous collaboration as thinking and task-execution partners.

Example: Let's brainstorm project risks. You list technical risks, I'll list operational ones.

Agency

Definition: Configuring AI to work independently on your behalf, shaping its behavior patterns.

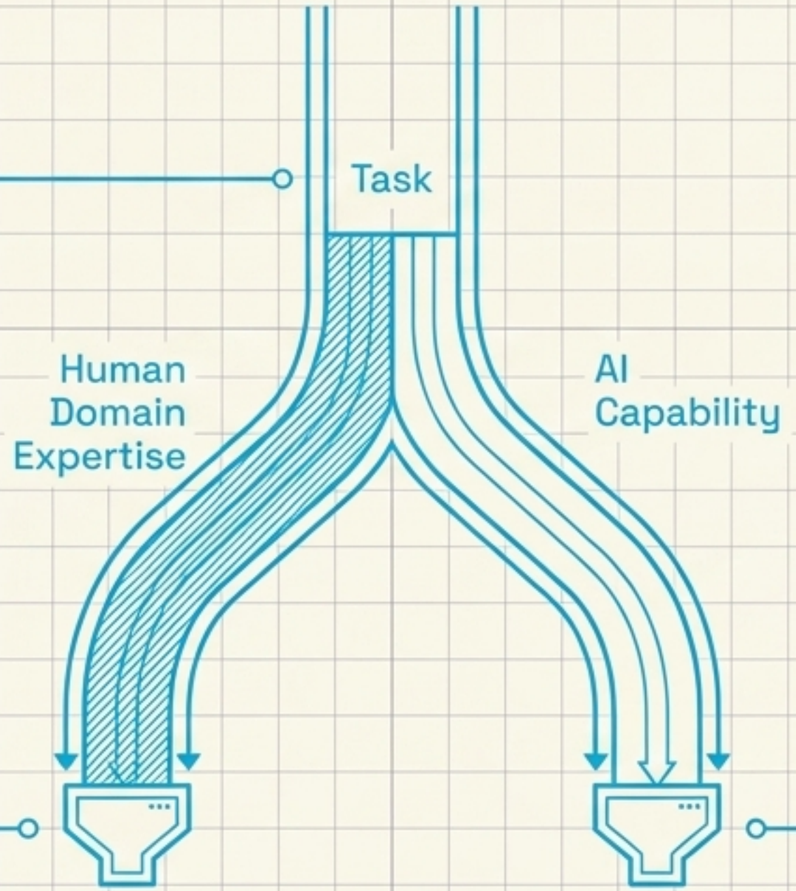

Example: Setting up an automated workflow to categorize incoming daily feedback based on custom rules.

NotebookLM

Delegation

Core Definition

Deciding strategically what work to do yourself versus what to hand off. This requires Problem, Platform, and Task awareness to build the most effective partnership, rather than just automating everything.

Real-World Application

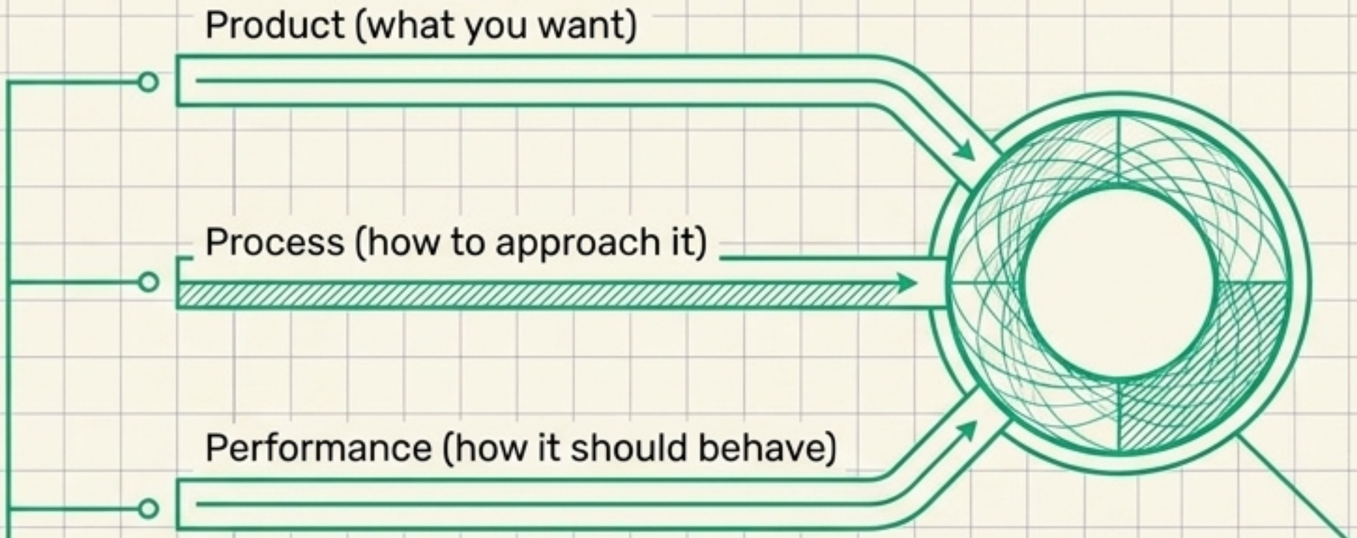

You are planning a complex project. You apply Delegation by keeping the strategic goal-setting for yourself (relying on your deep domain expertise) and delegating the drafting of the repetitive week-by-week scheduling template to the AI.

NotebookLM

Description

Core Definition

Communicating your intent clearly across three vectors: Product, Process, and Performance. AI cannot read your mind, and result quality relies heavily on up-front clarity.

Real-World Application

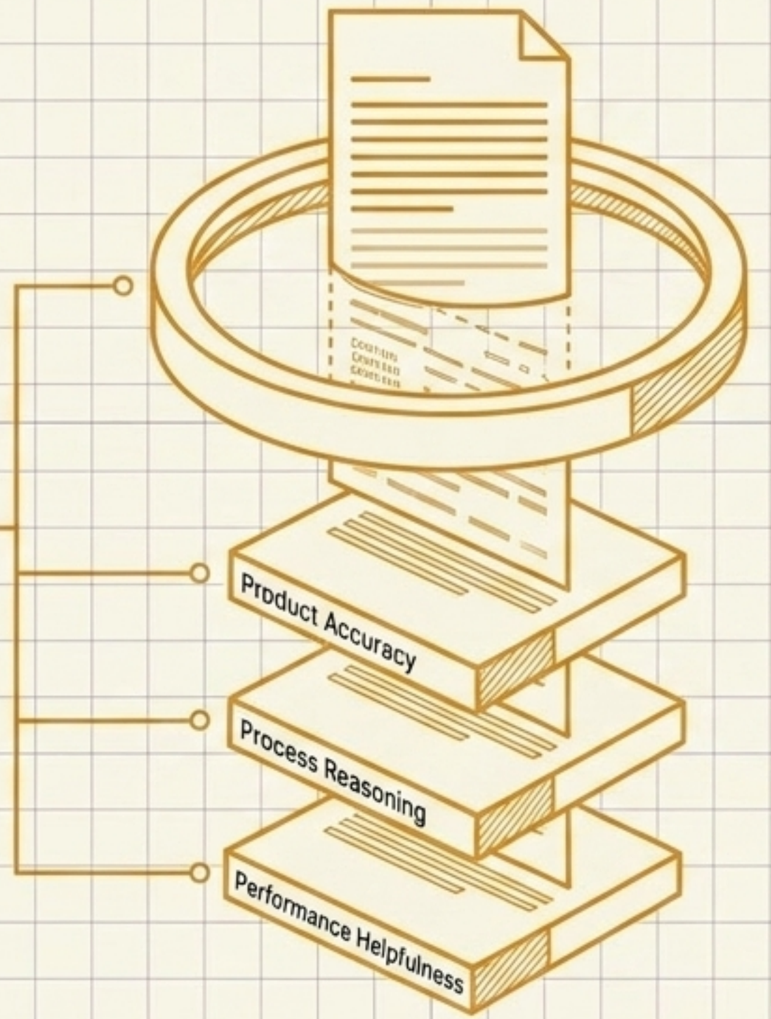

Before starting a complex task, you use the "ask the AI to improve your prompt" technique. You provide a basic prompt and ask the AI what context or constraints it needs from you to deliver a perfect result.

NotebookLM

Discernment

Core Definition

Critically evaluating the AI's output across Product, Process, and Performance to inform your next descriptive loop. Discernment determines exactly what kind of scrutiny to apply.

Real-World Application

The AI generates a fluent historical summary containing a highly specific, obscure statistic. Exercising Discernment, you flag that precise statistic as a potential hallucination and manually verify it against a trusted external source.

NotebookLM

Diligence

Core Definition

Using AI responsibly through careful Creation, Transparent disclosure, and taking ultimate Deployment ownership for anything you share. You vouch for the work as if you made it yourself.

Real-World Application

You draft a company memo using AI assistance. Exercising Diligence, you add a transparency statement at the bottom (“Drafted with Claude; data verified manually by author”) and take full responsibility for its accuracy.
